

Abstract of the Disclosure

The bullsnap fastener includes a rigid elongate member having a mid-section, a hook mounted to one end of the mid-section, a gate closing the hook, and an eye 5 mounted to an opposite end of the mid-section. The hook has a shank and a curved distal end. The hook extends from a first end of the mid-section so as to define a hook space between the shank and the distal end, and an opening between the distal end of the hook and the first end of the mid-section. At least one grip-enhancing member is mounted to and protrudes outwardly of the gate.
